

Cell Membrane and Transport Study Guide

What is a phospholipid? Draw and label one. Be sure to include the hydrophobic, hydrophilic, polar, and non-polar parts.

What three components are phospholipids made of?

Draw, label, and describe the cell membrane. Include the phospholipid bilayer, integral proteins, peripheral proteins, glycolipids, glycoproteins, peripheral proteins, and cholesterol

What does it mean to be selectively permeable? HOW does the phospholipid bilayer accomplish this?

What are the 3 main types of passive transport? Describe them.

Draw a picture of diffusion.

Draw a picture of facilitated diffusion. What two proteins are used, what is the difference in function?

Draw a picture of osmosis.

What are the 3 types of osmotic solutions? Describe them.

Draw a picture depicting what happens to a cell when it is placed in a hypotonic solution.

Draw a picture depicting what happens to a cell when it is placed in a hypertonic solution.

Draw a picture depicting what happens to a cell when it is placed in an isotonic solution.

Differentiate between plant and animal cell osmosis, and which solution makes them happy. Use faces to describe ☺ ☹:/ each solution

What are the 3 types of active transport? Define them.

Describe what happens during endocytosis. What are the three types? What are the differences between them?

What is exocytosis?

What is the main difference between passive and active transport?

Situation	Type of Transport	Form of Transport	In/Out/hypo/hyper, iso (osmosis only)
Oxygen moving from your lungs to your bloodstream			
Transport of hormones from one body tissue to another			
Freshwater fish is released into a marine environment			
A marine shark wanders into fresh waters in search of prey			
Import of food particles to be used to generate ATP
